

# Ringwood Feeder System

Ringwood feeder systems are designed to be used with modern, clay-based flocculants. The feeder consist of a hopper and flexible auger to convey approximately 30 lbs. per minute of product into the treatment tank. The hoppers come in two sizes: one to be used with manual bag dumping and the other to support a 2,000 lb. super sack. The auger height is adjustable and mounts to the top rim of any open-top tank. The feeder system is available with a 115V, 20A control panel, which can be mounted almost anywhere. Manual start buttons and timers control the product flow. Lower feed rate systems are also available.

## Super Sack Hopper

## Manual Bag Dump Hopper
